

## MANAGING COMPUTER SYSTEM ALERTS

### Abstract of the Disclosure

A method for creating, registering, and monitoring alerts for one computer or plurality of computers. In one embodiment, this method may include the act of alerting the operator when an event occurs on one of the computer's components. This method may include the act of allowing the user to select which alerts to enable and which alerts to disable from a list of all possible alerts. When an alert occurs, the present invention may display the particular computer's name, a description of the alert, the time and date of the alert, and details about a recommended course of action. The present invention also creates a log file for all alerts detected, regardless of whether the alert is displayed or not.
